

Sentor expands its managed security services offering to Finland via partnership with local company Optisec Oy.

Optisec Oy expands its business portfolio and initiates the marketing of security monitoring and management services in Finland. Service is delivered by Sentor MSS Ab, based in Sweden, with Optisec acting as local partner in Finland.

Says Mathias Elväng, Head of business development at Sentor "We are very pleased to have signed this agreement with Optisec. We see the Finnish market as very interesting for our services, and we already deliver services to a handful of Finnish companies. We also believe that Optisec will be an ideal partner for us, given their great experience and competence within our field."

Real-time security monitoring is a big challenge for companies who expand their business operations with their partners across network connections and Internet. Partners and subcontractors use e-business services after office hours, even 24 hours a day. Customers buy goods and execute banking transactions on-line continually. Furthermore, customers study companies' products and services on their websites. Open-all-hours e-business increases the exposure to external and internal security threats, which may be too much for many companies due to inadequate resources or competence.

Sentor's service covers full time (24x7x365) security monitoring, remote management, incident response and reporting. Service delivery includes required software and hardware. Remote security monitoring is executed via deployed or existing IDS/IPS/firewall devices at customer's premises, which collect security events and forward them in encrypted format to Sentor SOC. Security specialists at SOC monitor security events from customers network in real time and in case of an incident, customer is alerted immediately. Incidents are managed using pre-defined incident response processes. It is possible to expand the standard Sentor service with preventive and reactive security services, such as penetration testing, security audits, and establishment of in-house SIRT-capabilities.

Many companies already have initiatives regarding security monitoring and have deployed IDS or IPS solutions without capability for continuous monitoring and response. Being able to fully utilize (best bang for the buck) the best value/benefit for the investment, a customer can outsource security monitoring and management to Sentor.

Sentor security monitoring and management services are targeted for large and mid-size companies that require uninterrupted online business and high demand for availability. Sentor services are available in Finland from 15.6.2006.

Optisec Oy is a Finnish company, established in 2004, providing consulting, project management and security specialist services and technical solutions for IT risk and vulnerability management, security monitoring and log management.

About Sentor

With headquarters in Stockholm and offices in Malmo, Uppsala and London, Sentor provides total security solution to clients.

Using sophisticated data mining and correlation tools, supplemented with in-house developed software and methodology, Sentor's

security analysts monitor and provide client solutions in real-time for clients 24x7.

Sentor supports clients through the entire security process with an integrated security service comprising penetration tests,

network security audits and design and implementation of IT security solutions.
